Some real issues

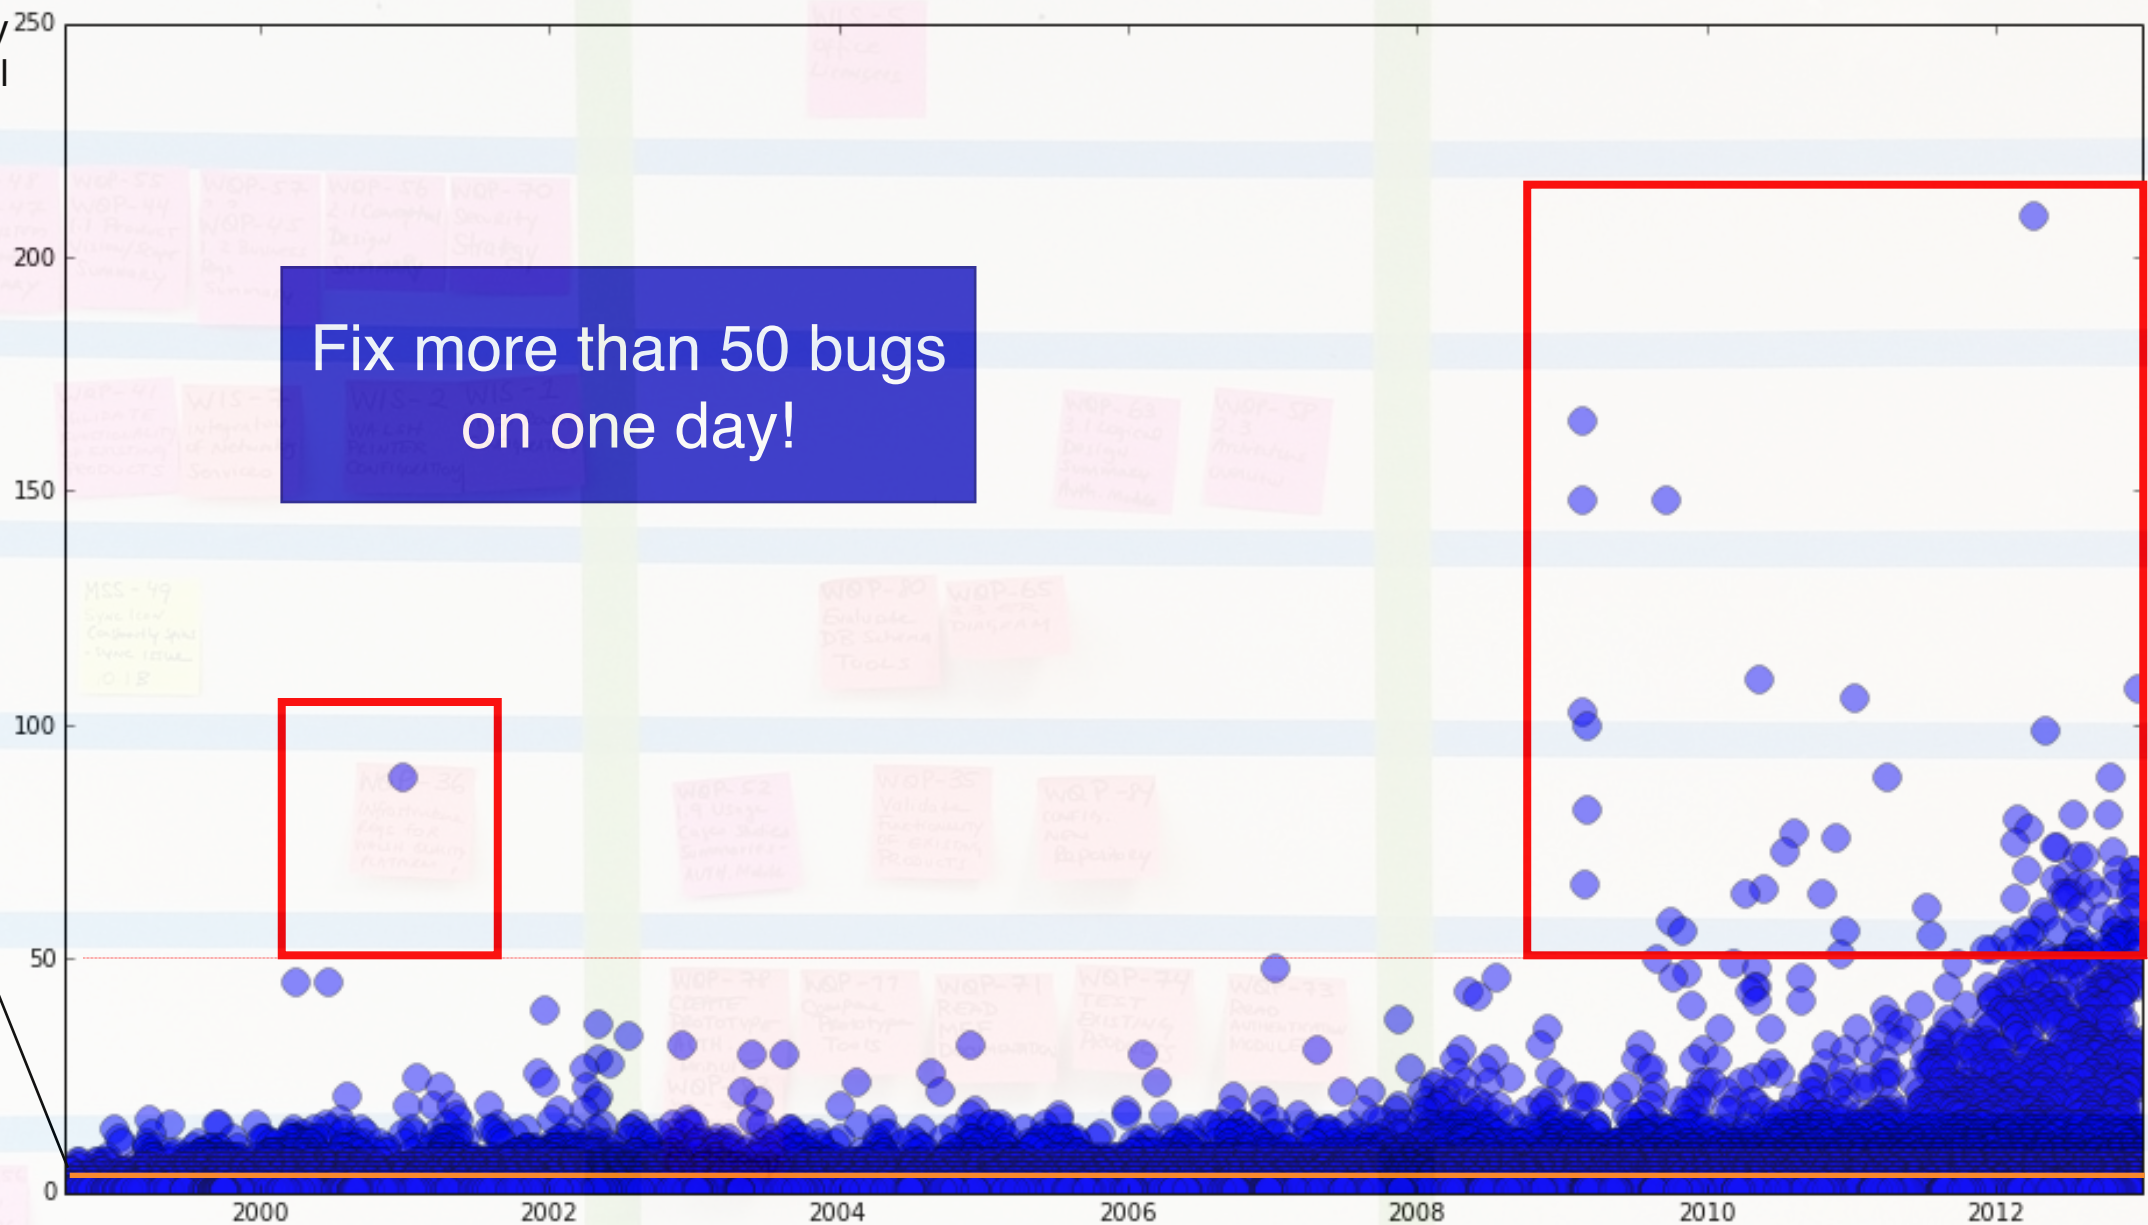

- **Task completion time** is important
 - For both research and practical development
- Count #bugs fixed by each dev on each day
- Experiment on official data from Mozilla

Some real issues

#bugs fixed by
each individual

Fix more than 50 bugs
on one day!

Mean: 1.92

Research on data quality?

Limited amount of work can be found.

Research mentioning data quality?

Data quality consideration is a minority practice [1][2].

[1] Michael Franklin Bosu and Stephen G. MacDonell. 2013. Data quality in empirical software engineering: a targeted review.

[2] Gernot A. Liebchen and Martin Shepperd. 2008. Data sets and data quality in software engineering.

Research on Data Quality?

Limited amount of work can be found.

Researchers love data.

**Yet few cares about
their quality.**

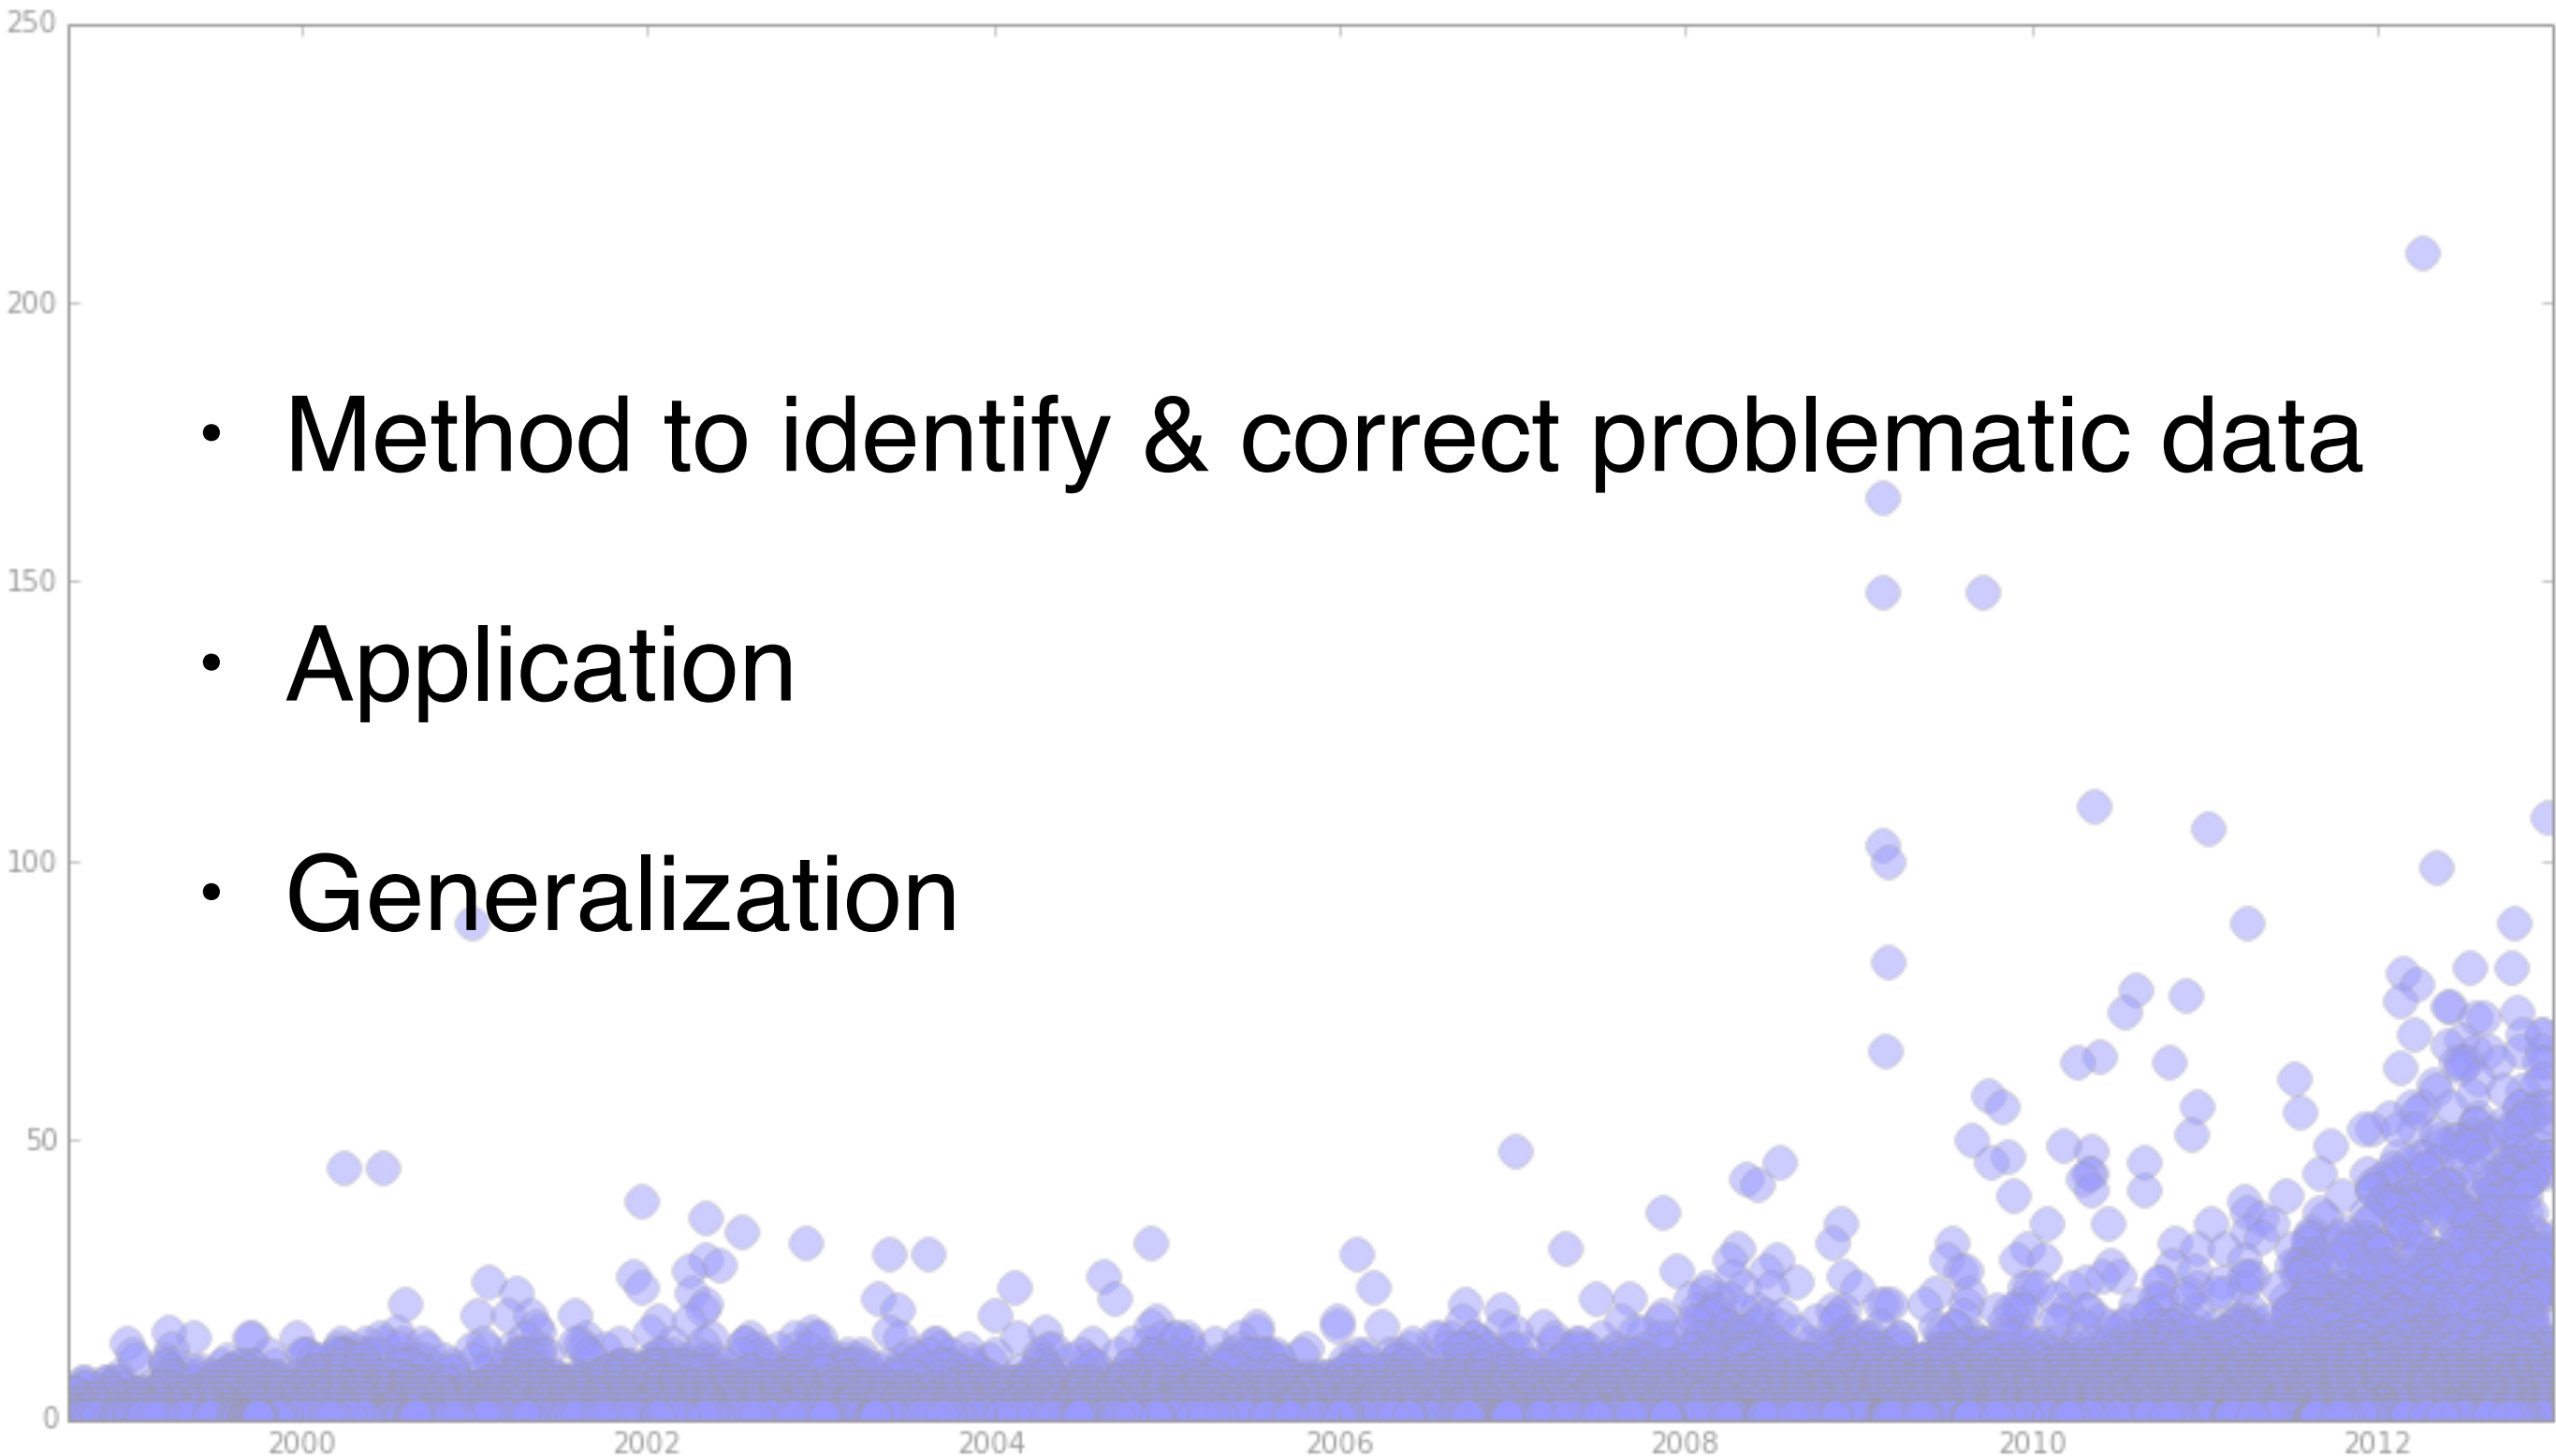

Data quality consideration is a minority practice [1][2].

[1] Michael Franklin Bosu and Stephen G. MacDonell. 2013. Data quality in empirical software engineering: a targeted review.

[2] Gernot A. Liebchen and Martin Shepperd. 2008. Data sets and data quality in software engineering.

So we try to fix the problem

- Method to identify & correct problematic data
- Application
- Generalization

The background features a light gray, hand-drawn style illustration. It includes a large sun or moon in the center, with stylized mountains and several birds in flight scattered around it. Two large, concentric, hand-drawn circles frame the central scene.

Before that...

Two observations about software repository data

• Capacity constraints

The background image shows a man with glasses sitting at a desk with a laptop. Behind him is a whiteboard with handwritten notes. The notes include 'Purpose: Role', 'Initiating', 'Supporting', 'Activities' (1. Small creative group, 2. Ion's/Activities, 3. SPN Meetings/Expat, 4. Organised events), 'IA', 'Startup Drinks (Megan)', 'Incubus', 'SPN Meetings/Expat', 'BSM TechWK (Media Push)', 'Lincoln', 'Open Coffee's', 'Welcome to jungle', 'on Friday', 'Support left', 'Lincoln', 'Random Meetings', and 'KC'.

• Data redundancies

The background image shows a long aisle in a server room. On both sides of the aisle are rows of server racks. Each rack is filled with many small, circular server components. The aisle is long and perspective is visible, with a person standing in the distance.

Method

for identifying and correcting
problematic software repository data

- Gather events from available sources
- Choose **primary type** to represent the desired task completion time

- Choose a set of **redundant event types** that approximate the desired task completion time
- Obtain event times $t_{i,k}$ for task i and event k .
- Use the distribution of $t_{i,k}$ for each k to **identify problematic values**. Define the method $isProblematic(t_{i,k})$ that returns the likelihood that the observed value $t_{i,k}$ is incorrect.

- Obtain values of $isProblematic(t_{i,k})$ for each redundant observation type k .

- **Correct problematic data.** Choose observations via:

$$correct(t_i) = \begin{cases} \arg \min_{k > 1} (isProblematic(t_{i,k})) & \text{if } isProblematic(t_{i1}) \\ t_{i1} & \text{if } !isProblematic(t_{i1}) \end{cases}$$

Application

of the proposed method

Data Gathering

- Official Bugzilla dump from Mozilla (January 2013)
- All code commits data from Mozilla (February 2014)

Primary Event Type

Bug-fix time recorded in issue tracking system.

cdawson	2012-04-03 08:58:14 PDT	Status	NEW	RESOLVED
		Resolution	---	FIXED
		Last Resolved		2012-04-03 08:58:14

Redundant Event Types?

Choose by understanding error mechanisms!

Redundant Event Types

- Investigation of error mechanism
 - Development Process Tracked By Other System
 - Dormant issues
 - Closing issues with committed patches
- Good substitutes:
 - Last comment time
 - Last code commit time

Problematic Data Identification

Data

Histogram

0-truncated negative binomial distribution

10 as cut-off

Problematic Data Correction

- Available options:
 - Last comment time
 - Last commit time
- Since last commit time will be used for testing, we use **last comment time** for correction:

$$correct(t) = \begin{cases} \text{last comment time} & \text{if } isProblematic(\text{ITS recorded time}) \\ \text{ITS recorded time} & \text{if } !isProblematic(\text{ITS recorded time}) \end{cases}$$

Data accuracy?

- 16% of the issues are fixed with a link pointing to a commit in version control system (VCS)
- We take the timestamp in VCS as gold standard for evaluation

$$\text{absolute error} = |\text{timestamp} - \text{vcs timestamp}|$$

$$\text{relative error} = \frac{|\text{timestamp} - \text{vcs timestamp}|}{\text{vcs timestamp} - \text{issue creation time}}$$

Absolute Error

Quantile	Uncorrected	Corrected
0.50	0d 07:17:13	0d 01:08:17
0.75	1d 00:16:33	1d 11:03:00
0.80	1d 08:52:50	0d 21:21:03
0.90	5d 21:59:42	4d 12:40:42
0.99	75d 03:43:39	72d 11:18:15
